

CLRS-70-DUAL

70 GPM Fully Automatic
Regenerable Ion Exchange System.

This system is designed to treat rinses from various metal finishing shop applications including rinses containing Hex Chrome, Cyanide, and various heavy metals in solution. Dual train operation with PLC control & graphics display of all functions, historic data collection, and communication with other data devices can make this system truly a “hands free” operation.

The columns are regenerated automatically without operator intervention other than minor filter maintenance. All regeneration and control valves are of ceramic construction for many years of trouble-free operation.
